1. Answer the following questions concerning the vector valued function

$$\mathbf{r}(t) = \left\langle \frac{1}{t}, \cos(\pi t), \sin(\pi t) \right\rangle$$

for $t \neq 0$.

- (a) (5 points) Evaluate

$$\lim_{t \rightarrow 1} \mathbf{r}(t).$$

Solution: The limit of a vector valued function can be found by taking the limit of its components.

$$\begin{aligned} \lim_{t \rightarrow 1} \mathbf{r}(t) &= \lim_{t \rightarrow 1} \left\langle \frac{1}{t}, \cos(\pi t), \sin(\pi t) \right\rangle, \\ &= \left\langle \lim_{t \rightarrow 1} \frac{1}{t}, \lim_{t \rightarrow 1} \cos(\pi t), \lim_{t \rightarrow 1} \sin(\pi t) \right\rangle, \\ &= \langle 1, -1, 0 \rangle. \end{aligned}$$

- (b) (5 points) Evaluate $\mathbf{r}''(t)$.

Solution: The derivative of a vector valued function can be found by taking the limit of its components.

$$\begin{aligned} \mathbf{r}''(t) &= \left\langle \frac{d^2}{dt^2} \frac{1}{t}, \frac{d^2}{dt^2} \cos(\pi t), \frac{d^2}{dt^2} \sin(\pi t) \right\rangle, \\ &= \left\langle \frac{2}{t^3}, -\pi^2 \cos(\pi t), -\pi^2 \sin(\pi t) \right\rangle. \end{aligned}$$

- (c) (5 points) Evaluate

$$\int_1^2 \mathbf{r}(t) \, dt.$$

Solution: The integral of a vector valued function can be found by taking the

limit of its components.

$$\begin{aligned}\int_1^2 \mathbf{r}(t) \, dt &= \left\langle \int_1^2 \frac{1}{t} \, dt, \int_1^2 \cos(\pi t) \, dt, \int_1^2 \sin(\pi t) \, dt \right\rangle, \\ &= \left\langle \ln(t) \Big|_1^2, \frac{\sin(\pi t)}{\pi} \Big|_1^2, -\frac{\cos(\pi t)}{\pi} \Big|_1^2 \right\rangle, \\ &= \left\langle \ln(2), 0, -\frac{2}{\pi} \right\rangle.\end{aligned}$$

2. Consider the vector valued function

$$\mathbf{r}(t) = \left\langle t^{3/2}, \frac{3}{2}t, (t-1)^{3/2} \right\rangle$$

for $1 \leq t \leq 2$,

- (a) (8 points) Find the arc-length function $s(t)$ of $\mathbf{r}(t)$.

Solution: Calculating the derivative gives

$$\mathbf{r}'(t) = \left\langle \frac{3}{2}\sqrt{t}, \frac{3}{2}, \frac{3}{2}\sqrt{t-1} \right\rangle$$

so that $\|\mathbf{r}'(t)\| = \frac{3}{2}\sqrt{t+1+t-1} = \frac{3}{2}\sqrt{2t}$ for all t . Thus

$$s(t) = \int_1^t \|\mathbf{r}'(u)\| du = \frac{3}{2} \int_1^t \sqrt{2u} du = \sqrt{2}(t^{3/2} - 1)$$

- (b) (7 points) What is the length of the curve parametrized by $\mathbf{r}(t)$?

Solution: The length is $s(4) = \sqrt{2}(4^{3/2} - 1) = 7\sqrt{2}$.

- (c) (5 points) Find the arc-length parametrization $\mathbf{r}(s)$.

Solution: Since $s = \sqrt{2}(t^{3/2} - 1)$ we have $t = \left(\frac{s}{\sqrt{2}} + 1\right)^{2/3}$. Substituting we have

$$\mathbf{r}(s) = \left\langle \frac{s}{\sqrt{2}} + 1, \frac{3}{2} \left(\frac{s}{\sqrt{2}} + 1\right)^{2/3}, \left(\left(\frac{s}{\sqrt{2}} + 1\right)^{2/3} - 1\right)^{3/2} \right\rangle. \quad (1)$$

3. Find the limit, if it exists. If the limit does not exist, explain why.

(a) (5 points)

$$\lim_{(x,y) \rightarrow (0,0)} \frac{|x||y|}{x^2 + y^2}$$

Solution: This limit does not exist. Checking along the y -axis gives zero, while along the line $x = y$ gives $1/2$.

(b) (5 points)

$$\lim_{(x,y) \rightarrow (0,0)} \cos\left(\frac{x^3}{x^2 + y^2}\right)$$

Solution: The limit inside of the cosine is 0 as one can check using polar coordinates. As cosine is a continuous function, this implies that the limit is $\cos(0) = 1$.

(c) (5 points)

$$\lim_{(x,y,z) \rightarrow (0,0,1)} \frac{3x + 2y + z}{x^2 + 2y^2 + 3z^2}$$

Solution: This function is continuous at $(0, 0, 1)$ so that its value is $1/3$.

4. Evaluate the partial derivatives, if they exist. If they do not exist, explain why.

(a) (6 points) $f_y(1, 1)$ for $f(x, y) = \sin(\pi xy) + x^2 + y^2$.

Solution: The partial is $f_y(x, y) = \pi x \cos(\pi xy) + 2y$. So evaluating at $(1, 1)$ gives $f_y(1, 1) = 2 - \pi$.

(b) (7 points) $f_{xy}(1, 1)$ for $f(x, y) = x \ln(y) + x^2 + y^2$.

Solution: Calculating gives $f_x(x, y) = \ln(y) + 2x$ and then $f_{xy}(x, y) = \frac{1}{y}$. Evaluating at $(1, 1)$ gives 1

(c) (7 points) $f_y(0, 0)$ for $f(x, y) = x + 2y|x| - 3y - 4x|y|$

Solution: Along the y -axis, x is zero so that $f(0, y) = -3y$ and the partial derivative with respect to y is -3 .

5. Consider the function $f(x, y) = xy + 2$.

(a) (5 points) Give the linearization $L(x, y)$ of $f(x, y)$ at $(1, -1)$.

Solution: The linearization is given by

$$L(x, y) = f(a, b) + f_x(a, b)(x - a) + f_y(a, b)(y - b).$$

In this case, we have

$$L(x, y) = 1 - (x - 1) + (y + 1) = 3 - x + y.$$

(b) (5 points) Use your result from part (a) to write the equation for the tangent plane to the graph of $f(x, y)$ at $(1, -1)$.

Solution: The equation for the tangent plane is $z = L(x, y)$ or $x - y + z = 3$.

6. Let

$$f(x, y, z) = xe^y + ye^z + z$$

- (a) (6 points) Find the gradient of f .

Solution: The gradient is $\nabla f(x, y, z) = \langle e^y, xe^y + e^z, ye^z + 1 \rangle$.

- (b) (7 points) Give the equation for the tangent plane of the level surface

$$f(x, y, z) = 1$$

at the point $(1, 0, 0)$.

Solution: Evaluating the gradient at this point gives $\nabla f(1, 0, 0) = \langle 1, 2, 1 \rangle$. This is the normal to the tangent plane, which of course passes through $(1, 0, 0)$, yielding the equation

$$x + 2y + z = 1.$$

- (c) (7 points) For what unit vector \mathbf{u} is f decreasing fastest when moving in the direction of \mathbf{u} starting at $(1, 0, 0)$?

Solution:

The negative of the gradient vector $-\nabla f = \langle -1, -2, -1 \rangle$ describes the direction of steepest descent. To make this a unit vector, we must normalize to obtain

$$\mathbf{u} = -\frac{\nabla f}{\|\nabla f\|} = \left\langle -\frac{\sqrt{6}}{6}, -\frac{\sqrt{6}}{3}, -\frac{\sqrt{6}}{6} \right\rangle$$

Coordinate systems

Cylindrical

$$x = r \cos(\theta)$$

$$y = r \sin(\theta)$$

$$z = z$$

$$r = \sqrt{x^2 + y^2}$$

$$\tan(\theta) = \frac{y}{x}$$

$$z = z$$

Spherical

$$x = \rho \cos(\theta) \sin(\varphi)$$

$$y = \rho \sin(\theta) \sin(\varphi)$$

$$z = \rho \cos(\varphi)$$

$$\rho = \sqrt{x^2 + y^2 + z^2}$$

$$\tan(\theta) = \frac{y}{x}$$

$$\cos(\varphi) = \frac{z}{\rho}$$

Derivative formulas

Directional derivative : $D_{\mathbf{u}}f(x, y) = \nabla f(x, y) \cdot \mathbf{u}$
